

ARCTIC Emergency Response Container

20 feet containers either placed on harbour piers or used as mobile units. They contain a boat plus the equipment suitable for each situation, such as:

Ladder down to the water | First Aid equipment | Medical supplies | Stretcher | Spine board | Life jackets | Life buoy with line | Dry suits and life vests for crew | Safety gear for crew | Power Generator | Fire extinguisher | Oil spill boom | Other oil recovery equipment

The boat hoist inside is battery/inverter operated. The Container can be equipped with solar panels or a power generator. Thus, it works even without mains power. The included Arctic A4 boat can be equipped with chart plotter, echo sounder, and a petrol- or electrical engine with 15 – 30 hp. Can be made autonomous, operated from a command center. A surveillance camera is also possible.

The container is mainly used on harbours, but can be equipped with a hook eye so that it can quickly be transported with a truck. To make the container look nicer, for example like a beach hut, it can be painted with custom colors and figures or graffiti. Together with a longer, 40 feet container, it can be a complete beach rescue station, containing beach rescue equipment, an ATV (all terrain vehicle), trailer etc.

Other places of operation besides harbours

- as a small rescue station for lakes
- as a mobile reserve sea rescue station
- at canals, locks and weirs
- as a mobile station on possible crisis sites across the world: standard container size, easy to transport, turnkey delivery, immediately ready to operate.
- as a garage for service boats, for towns with rivers or canals. The boat is safely locked but easy to deploy.
